HARTMANN

# The convenient and gentle way to take temperatures

When your little one suffers from fever, you are understandably worried. But it's natural for babies to have frequent high temperatures, because fever helps the body to fight off infections.

**With the new Thermoval® baby you can safely take temperatures without contact or sound.**

This way your child gets the peaceful sleep that it needs to recover.

The new Thermoval® baby also offers practical features, like measuring the temperature of food, milk bottles, bathwater and even ambient temperatures, for example in your baby's room.

# What you can do when y

## Temperature range for babies and toddlers (forehead measurement)

Normal temperature	35.8 – 36.9 °C
Increased temperature	37.0 – 37.5 °C
Light fever	37.6 – 38.0 °C
Moderate fever	38.1 – 38.5 °C
High fever	38.6 – 39.4 °C
Very high fever	39.5 – 42.0 °C

### Tips and advice

Our body temperature naturally fluctuates throughout the day. For example, your baby’s temperature can be a little bit warmer in the evening than it is in the morning.

If you sense that your baby suffers from fever, however, you will intuitively comfort your child and make it feel better.

Depending on how high the actual temperature climbs, there are certain additional measures you can take:

- Do not bundle your baby in too many clothes and blankets to avoid building up heat
- Make sure your baby drinks enough
- Check your baby’s temperature at regular intervals

# your baby has fever

## **Do consult a doctor if ...**

- ... your baby is less than 3 months of age
- ... you want to give medicine to your baby
- ... the increased temperature is accompanied by diarrhoea, vomiting and abdominal pain
- ... the fever lasts more than one day
- ... the fever recurs and there is a relapse
- ... the fever does not sink in spite of medication
- ... your baby doesn't drink enough
- ... your baby has febrile seizures
